

# Data Vis 2 Sheet 1

## General Ideas

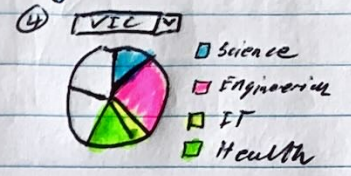

Bar Graph highlighting one aspect across states

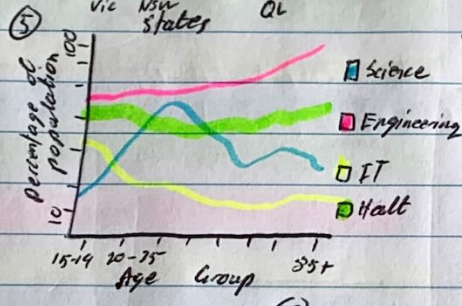

Stacked Bar graph many aspects across states

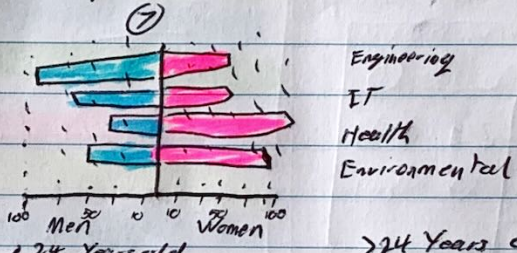

or a pie chart that is filtered by state

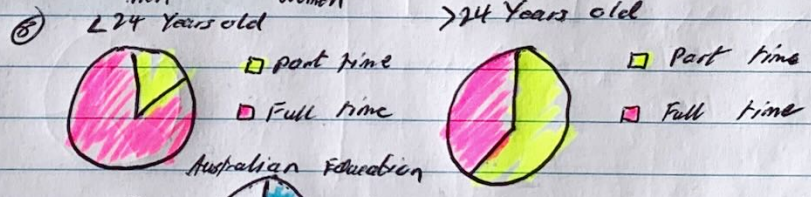

Line graph highlighting trends in AOS or Highest education across age groups

Area of study (AOS) by gender population percentage

Part time vs Fulltime students pie graphs

Total AOS by population percentage pie graph

## Categorize Filter

stacked bar graph<sup>③</sup> and filtered pie<sup>④</sup> chart show same data but stacked<sup>③</sup> allows for simultaneous comparison.

Similarly the bar graphs<sup>①</sup> and map<sup>②</sup> show identical data so only include one.

3 pie<sup>④⑤⑥</sup> charts is a lot limit the number

## Categorize

state related  
①, ②, ③, ④

state unrelated  
⑤, ⑥, ⑦, ⑧, ⑨, ⑩

## Combine and Refine

Combine filter from ④ to ⑥ and ⑩  
to limit number of pie charts

Combine Axis of ⑦ with states  
to compare two states  
AOS

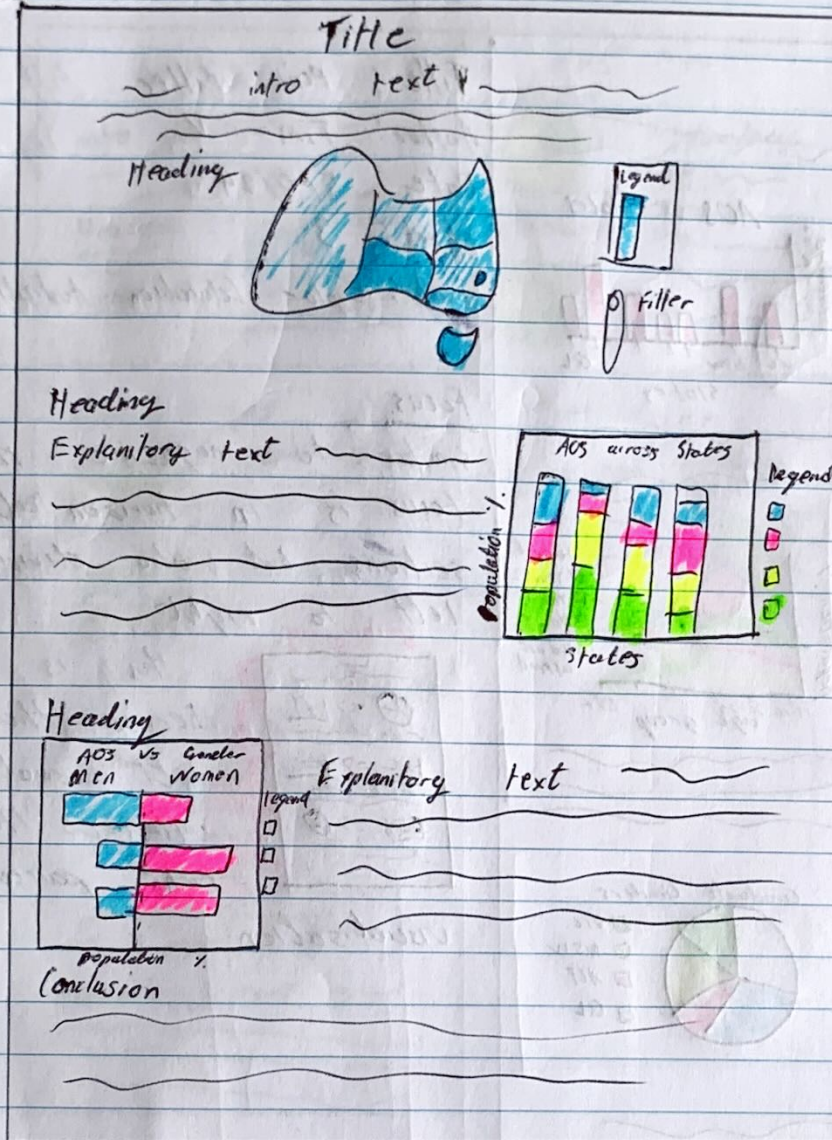

## Question

Each of these visualisations highlight a different aspect, relationship or trend in Australia's education satisfying the research question

# Data Vis Sheet 2

## Layout

Title: Magazine

Author: Tim V

Date: 5/10/24

Sheet: 2

Task: Exploring Australian Education

## Focus

Break down focus into sections

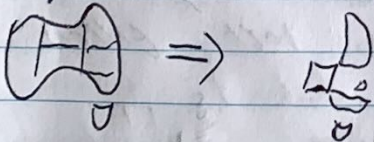

which tell a story as the sections move down the page

This is intuitive or it works similarly to a book, comic or magazine

## Components / operations

Map can be filtered by population percentage

Other components are static, should be visualisations from 2 different categories, ie one state related, one state unrelated

## Pro/cons

|                   |                           |
|-------------------|---------------------------|
| Simple            | Un-interactive            |
| Readable          | potentially too much text |
| Easy to implement | Not enough data shown     |
| Clear             |                           |

## Summary Info

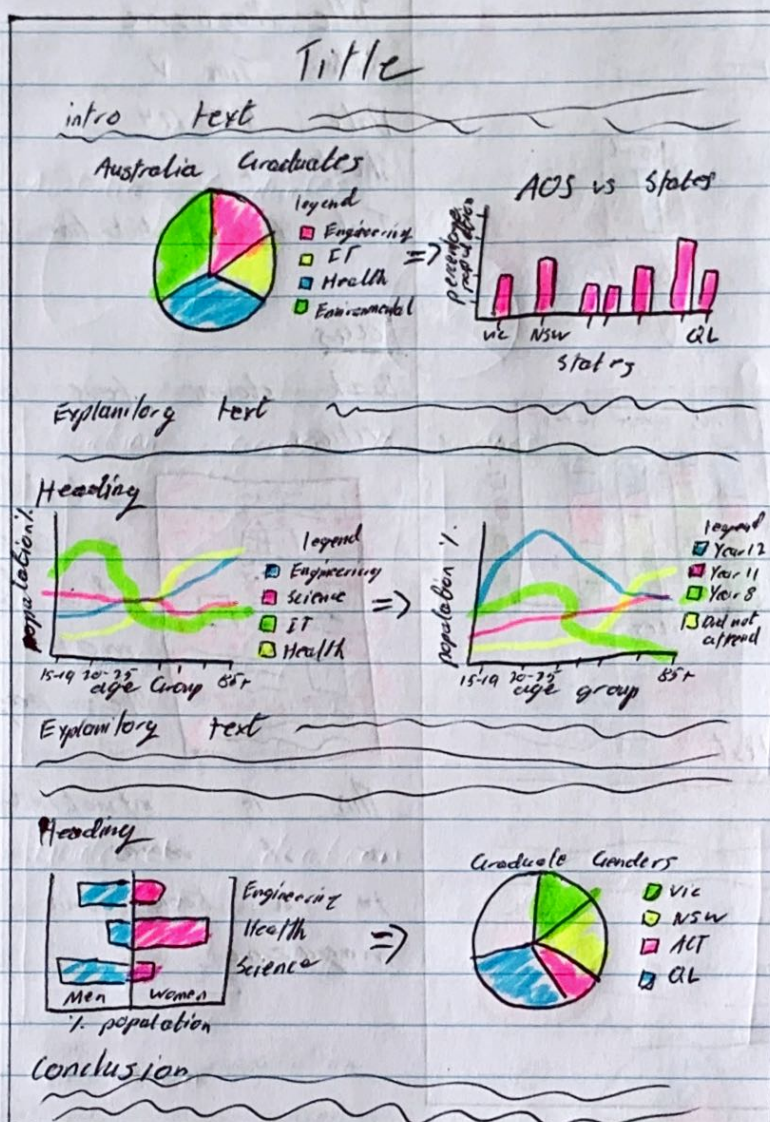

### Discussion

Solid design which conveys information effectively but is uninteractive with too much text

# Data Vis 2 sheet 3

## Layout

Title: Pair filter

Author: Tim V

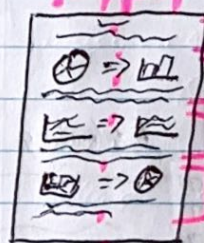

Date: 5/10/24

Sheet: 3

Task: Explor Education Australia

## Focus

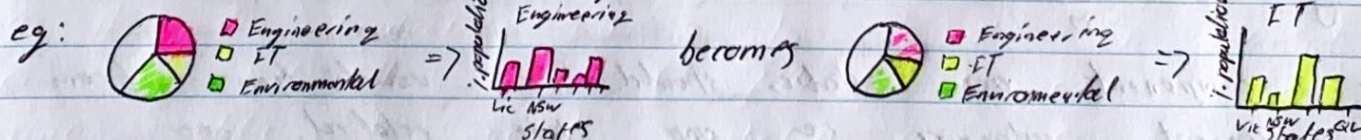

similar to magazine the focus is in horizontal sections but also divided left to right

this is because the left visualisation influences the right paired visualisation

## Components / Operations

The design has a common theme that being the visualisations are in pairs where the left filters the right to show specialised data

If we select IT on the left visualisation

## Pro/cons

Interactive Complicated  
lots of data difficult to implement  
Readable potentially un-intuitive

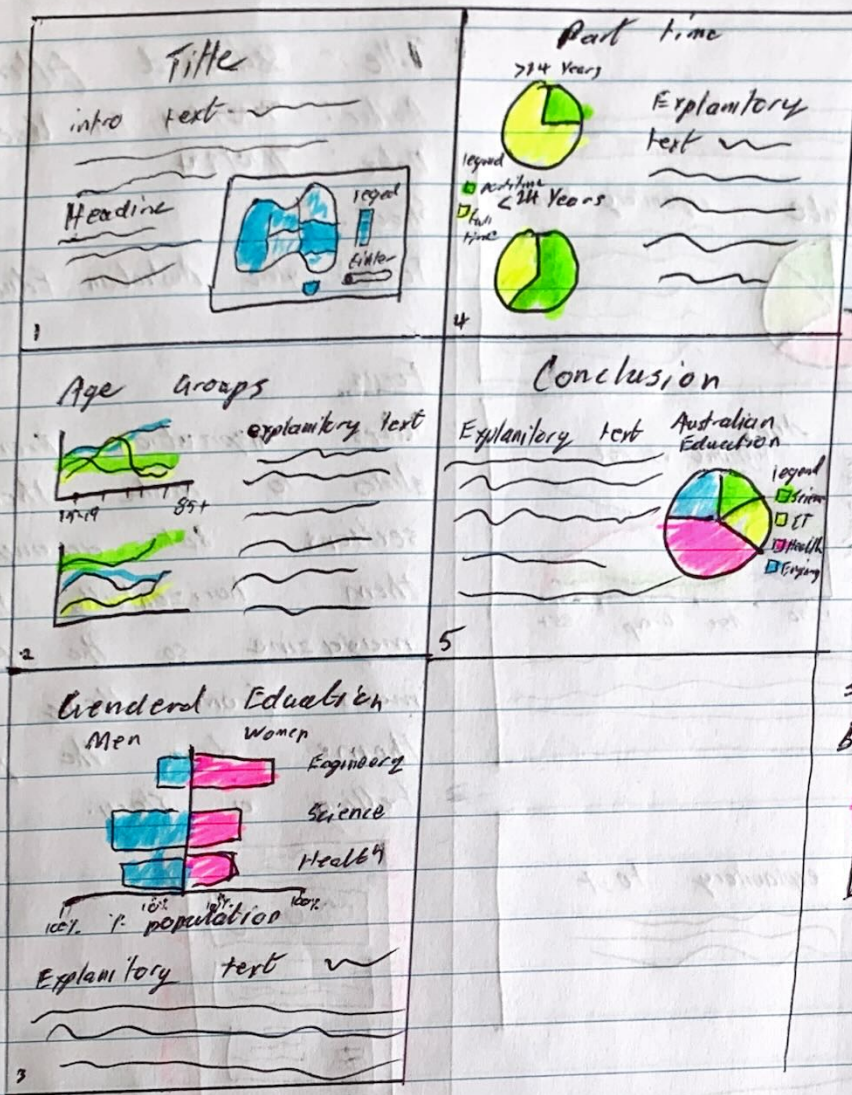

## Discussion

This design shows much more data and is much more interactive but more complicated and may be un-intuitive for users

# Data Vis 2 Sheet 4

## Layout

Title: Ribbon slides

Author: Tim ✓

Date: 7/10/24

Sheet: 4

Task: Exploring Australian Education

## Focus

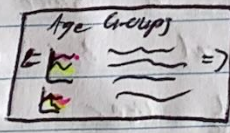

Each slide has a different focus allowing for related data to be high lighted at once and similar legends to be used only once

title  
text  
data

## Components / Operations

Website is a Ribbon which can be slid left or right to display the next / previous slide

Components of each slide relate to the theme of that slide

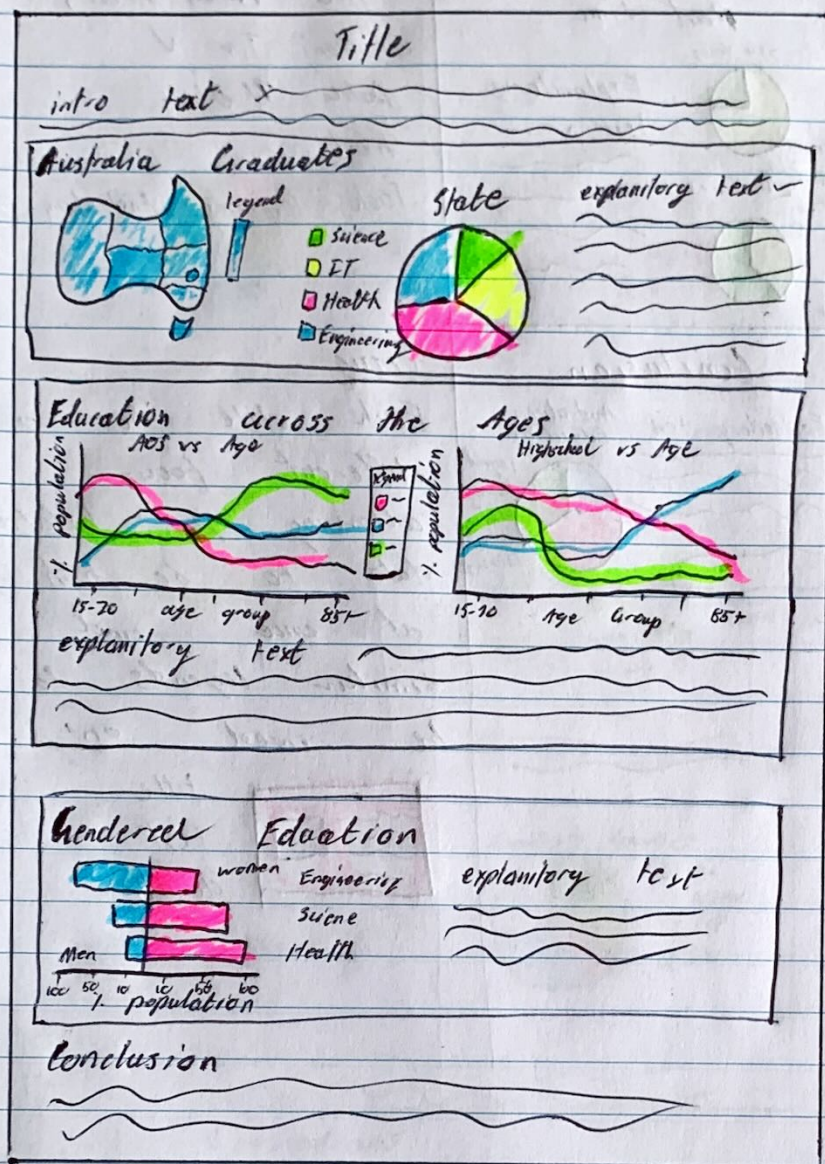

Pros / Cons  
Clear structure  
Themed data  
Readable  
Simple

## Discussion

The clear structure makes the themed data easy to navigate but stops comparison across data themes.

## Layout

Title: sectioned filtering

Author: ~~7/10/24~~ Tim Vogelbaum

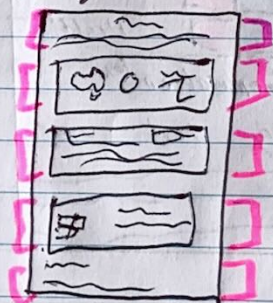

Date: 7/10/24

Sheet: 5

Task: Explore Australian Education

## Focus

Takes inspiration from slides to make themed sections but arranges them horizontally like magazine so the focus moves from theme to theme down the page telling a story.

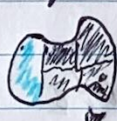

## Operation / Components

Some themed section filter in pairs like sheet 3 eg the Aus Graduates section, when a state is selected on the left the right is filtered but other sections remain static to prevent complicated user experience.

=>

\* when WA is clicked \*

## Detail

Use cleaned data to make visualisations and filters upload to git and combine into a HTML using pure CSS and Java script with selected fonts chosen in custom CSS file.
